

Maintenance and troubleshooting

AI Failures Museum | Team Project COM2020 | Group Java The Hutt

Routine maintenance

Apply Django and dependency updates in a staging copy first; run migrations; re-run the automated test suite (Django: `python manage.py test` from backend/). Refresh exhibit content using `seed_exhibits` when JSON seed files change (command reconciles DB with seed). Backup `db.sqlite3` and the `media/` tree before major changes. Review `docs/security.md` and `GroupJava_The_Hutt_CW2/5_technical/ security_checklist.pdf` periodically.

Common issues

Port already in use: run on another port (`python manage.py runserver 8001`) or stop the conflicting process.

Migration errors after pull: ensure correct `virtualenv`; `python manage.py migrate`; if schema is inconsistent in dev only, backup and consider `migrate --plan` before destructive fixes.

Missing images after seed: confirm files exist under `backend/media/exhibits/images/` and that `image_filename` entries in seed JSON match.

Permission errors (curator/admin): `UserProfile access_level` must be curator or admin; use `set_admin` for emergency admin promotion.

Static or media not loading in dev: `DEBUG True` serves media via Django; for production use the deployment guide and proper static/media hosting.

Support references

Repository `README.md` - Quick start and structure.

`docs/decisions/licence-decision.md` - Licence (MIT) and third-party notes.

`docs/security.md` - Security checklist summary.

`backend/exhibits/tests/` - Automated tests (pytest or Django test runner).
